Algorithm

What is an algorithm?

An algorithm is a finite set of precise instructions for performing a computation or for solving a problem.

Properties of algorithms

- Input from a specified set,
- Output from a specified set (solution),
- Definiteness of every step in the computation,
- Correctness of output for every possible input,
- Finiteness of the number of calculation steps,
- Effectiveness of each calculation step and
- Generality for a class of problems.

Definition and notations Algorithm Complexity Formulas

Basic methods for asymptotic behaviour

Counting number of elementary operations

Ch.1, p.2/19

Complexity

- Generally, not much interested in time and space complexity for small inputs.
- Given two algorithms A and B for solving problem P.

Input size	Algorithm A	Algorithm B	
n	5000 n	1.2^{n}	
10	50,000	6	
100	500,000	2,817,975	
1,000	5,000,000	1.5×10^{79}	
100,000	5×10^8	1.3×10^{7918}	

- B cannot be used for large inputs, while A is still feasible.
- So what is important is the growth of the complexity functions.
- Growth of time and space complexity with increasing input size nis a suitable measure for the comparison of algorithms.

Algorithm

Counting number of

Ch.1, p.4/1

Types of formulas for basic operation count

- Exact formulas, e.g., C(n) = n(n-1)/2.
- Formula indicating order of growth with specific multiplicative constant e.g., $C(n) \approx 0.5n^2$.
- Formula indicating order of growth with unknown multiplicative constant e.g., $C(n) \approx c.n^2$
- Most important: Order of growth within a constant multiple as $n \to \infty$

Asymptotic growth rate

A way of comparing functions that ignores constant factors and small input sizes

- ullet O(g(n)): class of functions f(n) that grow no faster than g(n)
- $\bullet \ \Theta(g(n))$: class of functions f(n) that grow at the same rate as g(n)
- ullet $\Omega(g(n))$: class of functions f(n) that grow at least as fast as g(n)

Counting number of elementary operations

Ch.1, p.5/19

Asymptotic upper bound - worst case

Asymptotic upper bound "big O"

T(n)=O(f(n)) iif $\exists c\in R^+,\ c>0$ and $\exists n_0\in N,\ n_0>0$ such that $\forall n>n_0\colon T(n)\leq c\times f(n)$

Example

Let $T(n) = 2n + 3n^3 + 5$. T(n) is in $O(n^3)$ with:

• $(c = 8 \text{ and } n_0 = 1) \text{ or } (c = 5 \text{ and } n_0 = 2)$

Principle: the lower-order terms are negligible.

Ch.1, p.7/1

Complexity classes - a small vocabulary

- Constant: O(1) (independing on the input size)
- Sub-linear or logarithmic: $O(\log n)$
- Linear: O(n)
- Quasi-linear: $O(n \log n)$
- Quadratic: $O(n^2)$
- Cubic: $O(n^3)$
- Polynomial: $O(n^p)$ ($O(n^2)$, $O(n^3)$, etc)
- ullet Quasi-polynomial: $O(n^{\log(n)})$
- Exponential: $O(2^n)$
- Factorial: O(n!)

Definition and notations Algorithm

Algorithm Complexity Formulas

Basic methods for asymptotic behavious analysis

Counting number of elementary operations

Asymtotic lower bound - best case

"big Omega"

 $T(n)=\Omega(f(n))$ iif $\exists c\in R^+$, c>0 and $\exists n_0\in N$, $n_0>0$ such that $\forall n>n_0\colon T(n)\geq c\times f(n)$

Example

Let $T(n) = 2n + 3n^3 + 5$. T(n) is in $\Omega(n^3)$ with:

• $(c = 1 \text{ and } n_0 = 1)$

Complexit

Formulas Basic methods for

asymptotic behaviour analysis Counting number of elementary operation

lementary operatio

Ch.1, p.8/1

Ch.1, p.6/19

Asymtotic approximating bound - average case

"big Theta"

$$T(n) = \Theta(f(n))$$
 iif $\exists c_1, c_2 \in R^+, c_1 > 0, c_2 > 0$ and $\exists n_0 \in N, n_0 > 0$

such that $\forall n > n_0$: $c_1 \times f(n) \leq T(n) \leq c_2 \times f(n)$

Property

$$f(n) = O(g(n))$$
 and $f(n) = \Omega(g(n)) \Longrightarrow f(n) = \Theta(g(n))$

Example

Let
$$T(n) = 2n + 3n^3 + 5$$
.
So, $T(n)$ is in $O(n^3)$ and in $\Omega(n^3)$.
Consequently, $T(n)$ is in $\Theta(n^3)$.

Exercise

- $T(n) = 3 + 5n^2 \Rightarrow T(n) = \Theta(n^2)$?
- $\bullet \ \ \text{if} \ T(n) = \left\{ \begin{array}{ccc} 2n+5 & if & n & \text{is even} \\ n^2-n+1 & if & n & \text{is odd} \end{array} \right. \text{, then } T(n) = O(?) \ \text{and} \ T(n) = \Omega(?).$

Other properties

Not transitive

- $f(n) = n^2$; g(n) = n
- $\Rightarrow f(n) = O(n^2) = g(n)$ but $f(n) \neq g(n)$

Transitivity

- $\bullet \ f(n) = O(g(n)) \ \& \ g(n) = O(h(n)) \Rightarrow f(n) = O(h(n))$
- $\bullet \ f(n) = \Omega(g(n)) \ \& \ g(n) = \Omega(h(n)) \Rightarrow f(n) = \Omega(h(n))$
- $f(n) = \Theta(g(n))$ & $g(n) = \Theta(h(n)) \Rightarrow f(n) = \Theta(h(n))$

Additivity

- $f(n) = O(h(n)) \& g(n) = O(h(n)) \Rightarrow f(n) + g(n) = O(h(n))$
- $f(n) = \Omega(h(n))$ & $g(n) = \Omega(h(n)) \Rightarrow f(n) + g(n) = \Omega(h(n))$
- $f(n) = \Theta(h(n))$ & $g(n) = \Theta(h(n)) \Rightarrow f(n) + g(n) = \Theta(h(n))$

Exercise

Compare the asymptotic behaviours of

- $1 2^n$ and 10^n
- $\log_2 n$ and $\log_{10} n$
- 1 Prove that for any positive functions f and g, f(n) + g(n) and max(f(n); g(n)) are asymptotically equivalent.
- 2 Give a (necessary and sufficient) condition on positive functions f and g to ensure that f(n) + g(n) and f(n) are asymptotically equivalent.
